Check this report: https://backteststation.github.io/verify.html (ID S-07, code 8ba813dd). PASS = edge held up in this test; CAUTION = mixed or too little evidence; FAIL = no edge, or data that cannot be trusted.

Test confidence: 97.5%

How sure we are that these are the results you would really have had in this period. Why it is not 100%:

• –1.0: a backtest replays candles; live fills, latency and outages are not reproduced exactly

• –1.5: inside each candle the order of high and low is unknown, so stops and targets hit in the same candle are approximated

Data: Binance spot 5m candles from Binance's public API · **Period:** 2024-11-01 00:00 to 2026-10-31 00:00 UTC · **Coins (20):** BTC, ETH, SOL, XRP, DOGE, ADA, DOT, NEAR, ATOM, FIL, INJ, ARB, OP, APT, SUI, LDO, FET, HBAR, ALGO, ICP

Results

Period	2024-11-01 to 2026-10-31 (729 days)
Total return	-25.8% (-258.06 USDT)
Holding the same coins	-37.8%
Yearly growth (CAGR)	-13.9%
Max drawdown	32.3%
Trades / win rate	652 / 69.9%
Profit factor	0.62
Sharpe / Sortino	-0.95 / -0.55
With twice the fee	-47.7%
Profitable years	1 of 3
Lookahead bias	Not detected

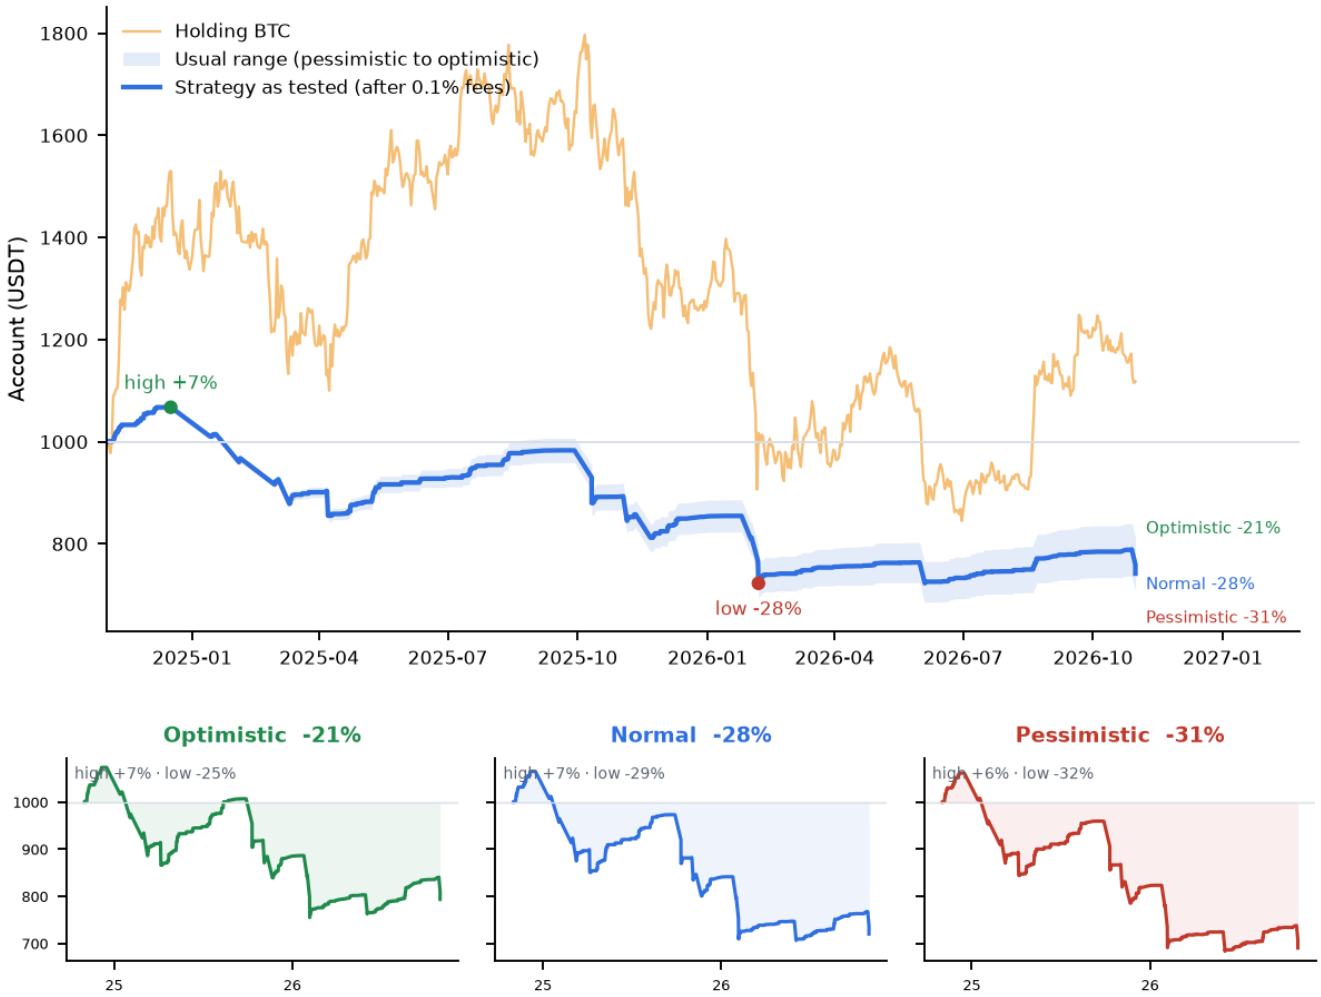

Red flags

• Profitable in 1 of 3 calendar years.

• Maximum drawdown 32% of the account.

We test the past, not the future. This is an analysis of past performance. It is not a forecast of future results and not investment advice.

Account growth

Year by year

Year	Trades	Win rate	Profit	Return
2024	63	78%	67.55 USDT	+6.8%
2025	300	70%	-214.60 USDT	-21.5%
2026	289	68%	-111.01 USDT	-11.1%

By market condition (BTC 30-day trend at entry)

Market	Trades	Win rate	Profit
Down (< -10%)	130	69%	-35.62 USDT
Up (> +10%)	204	78%	47.91 USDT
Sideways	318	65%	-270.34 USDT

Optimistic, normal and pessimistic

Case	Fee / side	Slippage / side	Result	Profit factor	Max drawdown
Optimistic	0.075%	0.00%	-20.6%	0.70	29.7%
Normal	0.100%	0.01%	-28.0%	0.60	33.7%
Pessimistic	0.100%	0.03%	-31.0%	0.56	35.6%

The verdict uses the numbers as tested. This is the usual range around them, each case at most 20% away from the tested result; extreme costs are covered by the fee stress test. What can move the result inside this range:

• **Fills:** large orders or thin coins may fill only partly, or a little later than the signal.

• **Slippage:** market orders fill a little worse than the candle price, more in fast markets and small coins.

• **Fees:** your exchange, VIP tier, BNB discount or maker orders change the cost of every trade.

• **Market conditions:** the tested period had its own trend and volatility; another market can change results a lot.

• **Latency and downtime:** delays between signal and order, API errors and exchange outages.

• **Funding (futures):** rates change over time and depend on the trade's direction.

• **Data and size:** prices differ slightly between exchanges, and results scale only while your size is small against the coin's volume.

Assumptions

Engine	Freqtrade backtesting with the strategy's own settings (ROI, stoploss, exits)
Data	Binance spot candles, 20 coins: BTC, ETH, SOL, XRP, DOGE, ADA, DOT, NEAR, ATOM, FIL, INJ, ARB, OP, APT, S
Account	1000 USDT, up to 5 trades at once, full balance shared
Fees	0.1% per side (Binance spot taker)
Lookahead check	Freqtrade lookahead-analysis on Jun-Sep 2026

Disclaimer

This is an analysis of past performance. It is not a forecast of future results and not investment advice. The strategy belongs to its authors and is published under GPL-3.0; Backtest Station only tested it. Other settings, coins, exchanges or periods can give different results. Nothing here is a recommendation to use any strategy.

Authors: if other settings represent your strategy better, send them to @BacktestStationBot and we will retest it free and update this report. Verified owners can also ask for removal.
